

## **Dashboard 3: Cashflow Behavior & Variance Analysis – Weekly Summary**

This week, I designed and developed Dashboard 3 within the TreasuryIQ BI Module, focusing on cashflow behavior and variance analysis. The dashboard analyzes the gap between expected and actual cashflows, helping assess forecast accuracy and liquidity stability. I built key KPIs including Total Expected Cashflow, Total Actual Cashflow, Variance, Variance %, Average Daily Variance, Volatility (Standard Deviation), and Forecast Accuracy Score. I implemented multiple visualizations to provide deep insights: - A trend chart comparing expected vs actual cashflows to evaluate forecasting reliability. - A variance trend chart to detect volatility spikes and unstable periods. - A variance distribution histogram to understand deviation patterns. - Category-level variance breakdowns for both inflows (EMI, prepayment, fees) and outflows (interest, principal, operational). - Rolling volatility trends (7-day and 30-day) to monitor liquidity instability over time. - A seasonality heatmap to identify recurring patterns such as month-end spikes. Additionally, I configured filters and drill-down capabilities to allow detailed analysis by date, segment, region, and transaction level. Conditional formatting was applied to highlight high-risk variance scenarios. Overall, this dashboard enables better visibility into forecast accuracy, identifies volatility drivers, and supports proactive liquidity planning.
